

# Technical Report Series

## A Profile of 2013 Mortgage Borrowers: Statistics from the National Survey of Mortgage Originations

### Technical Report 3.1

**Updated March 21, 2017**

This document was prepared by Robert B. Avery, Mary F. Bilinski, Brian K. Bucks, Christine Chai, Tim Critchfield, Ian H. Keith, Ismail E. Mohamed, Forrest W. Pafenberg, Saty Patrabansh, Jay D. Schultz, and Claudia E. Wood. It updates and replaces Technical Report 16-01 originally posted on May 27, 2016.

## Table of Contents

1.	Introduction.....	1
2.	Comparing the 2013 NSMO with 2013 Home Mortgage Disclosure Act Data .....	2
3.	Profile of 2013 Mortgage Borrowers .....	4
4.	The Search for a Mortgage .....	9
5.	Selecting a Mortgage .....	18
6.	During the Application Process .....	24
7.	Closing on a Mortgage .....	28
8.	Satisfaction with Mortgage Terms, Mortgage Process and Information .....	32
9.	Opinions on Financial Responsibility.....	35
10.	Recent Changes in Neighborhood Housing.....	38
11.	Expectations on Neighborhood House Prices and Neighborhood Desirability .....	42
12.	Financial Expectations .....	42
13.	Summary and Further Work .....	48
	Appendix.....	A-1

## 1. Introduction

This Report provides information about the first set of responses received to the National Survey of Mortgage Originations (NSMO or survey), which is jointly administered by the Federal Housing Finance Agency (FHFA) and the Consumer Financial Protection Bureau (CFPB). The survey collects information from a representative sample of recent mortgage borrowers about their experiences in choosing and in taking out a mortgage. It is designed to provide researchers, policy makers, and other interested parties with comprehensive data about the consumer experience when getting a mortgage.

The survey data contained in this Report pertains to borrowers who obtained a mortgage in 2013. As a result, these survey data provide a baseline of information prior to the effective dates of recent mortgage reforms, including revised mortgage disclosures, resulting from the Dodd-Frank Wall Street Reform and Consumer Protection Act.

The NSMO is a recurring quarterly mail survey of about 6,000 new mortgage borrowers each quarter using a sampling frame drawn from the National Mortgage Database (NMDB).<sup>1</sup> The NMDB in turn is a representative 1-in-20 sample of closed-end first-lien mortgages reported to Experian, one of the three national credit repositories. From the first quarter of 2014 to the first quarter of 2015, NSMO sampled 19,436 mortgages originated in 2013 with an average sampling rate of 1-in-423. Of the solicited surveys, 6,078 usable responses were received, making the effective response rate for the 2013 originations 31.3 percent.<sup>2</sup> A total of 8.15 million closed-end first-lien mortgages were originated in 2013, which means that each average useable survey response is representative of 1,341 mortgages.<sup>3</sup>

---

<sup>1</sup> The National Mortgage Database project is a multi-year project being jointly undertaken by the Federal Housing Finance Agency (FHFA) and the Consumer Financial Protection Bureau (CFPB). The project is designed to provide a source of information about the U.S. mortgage market based on a five percent sample of residential mortgages. The NMDB will enable FHFA to meet the statutory requirements of section 1324(c) of the Federal Housing Enterprises Financial Safety and Soundness Act of 1992, as amended by the Housing and Economic Recovery Act of 2008, to conduct a monthly mortgage market survey. For CFPB, the NMDB project will support policymaking and research efforts and help identify and understand emerging mortgage and housing market trends. For further information on the NMDB, see National Mortgage Database Technical Report 1.1 [https://www.fhfa.gov/PolicyProgramsResearch/Programs/Documents/NMDB-technical-report\\_1pt1\\_122216.pdf](https://www.fhfa.gov/PolicyProgramsResearch/Programs/Documents/NMDB-technical-report_1pt1_122216.pdf). For additional background, see also the Appendix.

<sup>2</sup> There are several ways calculations based on the NSMO raw survey responses may not be representative of the population as a whole and, as a result, survey responses are appropriately weighted. Commonly, in survey sampling, some individuals chosen for the sample are unwilling or unable to participate in the survey. Nonresponse bias (either complete nonresponse to the survey or nonresponse to selected items within the survey) is the bias that results when respondents differ in meaningful ways from non-respondents. To address this nonresponse bias, the NSMO uses weighting to adjust for differential response to the survey. In addition, to address missing information on individual questions within the survey, the NSMO uses statistical methods to impute missing data; the technique makes multiple estimates of missing data to allow for an estimate of the uncertainty attributable to this type of nonresponse. See National Mortgage Database Technical Report 2.1, [https://www.fhfa.gov/PolicyProgramsResearch/Programs/Documents/NMDB-technical-report\\_2pt1\\_122216.pdf](https://www.fhfa.gov/PolicyProgramsResearch/Programs/Documents/NMDB-technical-report_2pt1_122216.pdf) for more details.

<sup>3</sup> The weighted percentages reported in this technical document represent the respondents who took out a mortgage

The NSMO is a voluntary survey, and the questions included in the survey focus on topics such as mortgage shopping behavior, mortgage closing experiences, and other information not readily available from any other source, such as expectations regarding house price appreciation, critical household financial events, and life events such as unemployment, large medical expenses, or divorce. In general, borrowers are not asked to provide information about mortgage terms in the questionnaire since these fields are available in the Experian data. However, the survey collects a limited amount of information on the mortgage to verify that the credit repository records and survey responses pertain to the same mortgage.

The NSMO survey design calls for a sample drawn from mortgages newly reported to Experian during the previous quarter. In the first year of the survey there was a catch up period to cover all mortgages originated in 2013 and reported to Experian by September 2014. This report presents results from the 6,078 responses to the first five quarters of the survey, and provides an overview of the mortgage market and borrowers' experiences in 2013. It is intended to be the first in a series of annual reports on new mortgage borrowers based on the NSMO.

This report is organized as follows. Section two compares the 2013 NSMO with 2013 Home Mortgage Disclosure Act (HMDA) data. Section three contains information about the overall profile of survey respondents in 2013, including their demographic characteristics and what kind of mortgages they obtained. Sections four through seven describe how the 2013 borrowers shopped for their mortgages and the application and closing processes. Section eight presents information about borrowers' mortgage outcomes and measures of their satisfaction in the mortgage application and closing process. Section nine discusses borrowers' opinions on financial responsibility and section ten examines borrowers' opinions on the neighborhood where they obtained their mortgage. Sections eleven and twelve discuss 2013 mortgage borrower's expectations for house prices, neighborhood desirability, and their own financial circumstances over the next couple of years. Finally, section thirteen offers next steps. The Appendix provides details on the overall NMDB project and the sample frame and data preparation procedures for the NSMO.

## **2. Comparing the 2013 NSMO with 2013 Home Mortgage Disclosure Act Data**

To provide context about the representative scope of the NSMO, this section compares the NSMO sample of mortgages originated in 2013 with 2013 Home Mortgage Disclosure Act data. While the HMDA data do have some well-known coverage issues due to lender reporting requirements, the annual HMDA data are believed to be close to a universe of all first-lien mortgages originated in the United States. By design, the NMDB data are constructed to be representative of approximately the same universe. Because the NSMO is a representative

---

in 2013. The words "respondent" and "borrower" are used interchangeably throughout the document.

sample of the NMDB data, it should also be representative of the same universe. Consequently, the HMDA and NMSO estimates of the universe of first-lien mortgages should be comparable to one another. The NSMO estimated 7.5 million originations of first liens on owner-occupied homes in 2013 with a total loan volume of \$1.58 trillion. The 2013 collection for the Home Mortgage Disclosure Act included 7.1 million originations of first liens on owner-occupied housing covering \$1.56 trillion. Thus, the count of mortgages covered by the NSMO was five percent greater than in HMDA and the amount was only two percent greater. Accordingly, the average loans size in the NSMO is smaller than in HMDA—\$212,165 compared with \$219,229.

Both NSMO and HMDA break down total originations of first liens on owner-occupied loans into home purchase and refinance transactions. The NSMO showed 2.9 million loans to purchase a home in 2013 with a loan volume of \$620 billion compared with 2.7 million loans and a loan volume of \$625 billion in the 2013 HMDA data. The NSMO showed 4.6 million transactions to refinance a loan for \$962 billion, while HMDA showed 4.4 million for \$931 billion.

**Table 1. Comparison of Mortgage Originations, 2013**  
(Count and Dollar Volume)

Mortgage Originations	National Survey of Mortgage Originations (NSMO)		Home Mortgage Disclosure Act (HMDA)	
	Count (Thousands) <sup>1</sup>	Volume (Billions Dollar)	Count (Thousands)	Volume (Billions Dollar)
<i>Owner-occupied</i>	7,474	1,585	7,096	1,556
Purchase	2,869	622	2,703	625
Refinance	4,604	963	4,393	931
<i>Not owner-occupied</i>	678	125	1,123	316

Source: National Survey of Mortgage Originations, 2013, and Home Mortgage Disclosure Act, 2013

Notes: 1. The owner-occupied count total from the NSMO does not equal the sum of purchase and refinance counts from the NSMO due to rounding.

The greater count and dollar volumes of loans in the NSMO compared with 2013 HMDA likely stems in large part from differences in the set of lenders that the two data sets cover. Specifically, some lenders do not report loans for HMDA because they do not meet the asset-size, location, federally related, or loan activity requirements for reporting. In contrast, loans from these lenders would be sampled in the NSMO.

The NSMO and 2013 HMDA data particularly diverge in their coverage of mortgages on properties that are not owner-occupied. HMDA includes about 1.1 million such mortgages, more than 60 percent greater than captured in the NSMO. The NSMO reported \$124 billion in mortgage originations in 2013 that were not owner-occupied properties, while HMDA showed \$316 billion. HMDA covers many larger mortgages that were both not owner-occupied and included business partnerships, and these mortgages would not be covered by NSMO. Reconciling the sources of these differences requires further investigation.

### 3. Profile of 2014 Mortgage Borrowers

Tables 2 through 5 present percentage distributions of loan and property characteristics for several demographic groups, loan types, and properties from the NSMO. Table 2 presents loan size and mortgage term to maturity. Table 3 presents credit score, Table 4 presents loan type, and Table 5 presents property type. The bottom row of each table shows the percentage distribution of each loan or property characteristic. Finally, Table 6 presents the percent of household life events experienced by survey respondents over the last couple of years.

About 48 percent of respondents were between the ages of 36 and 55 years, and nearly 20 percent were 56 to 65 years old (See Table 2). Twenty-two percent were 35 years old or younger and 11 percent were older than 65. By race and ethnicity, 78 percent of respondents reported that they were non-Hispanic white with seven percent reporting they were Hispanic white. Asians were nearly seven percent of respondents, and Black or African Americans accounted for six percent of respondents. Nearly three percent indicated that they were mixed or other race.

More than three-quarters of households in the NSMO are couples with 71 percent reporting they were married and seven percent reporting they were living with a partner. More than 20 percent of respondents indicated they were single; with 10 percent reporting they were male and 13 percent reporting they were female. More than 86 percent of borrowers' households included at least one full-time worker. Less than one in five respondents reported that they were active duty or veterans of the U.S. military with 82 percent indicating they had no current or past military service.

Comparing respondents to the NSMO with 2013 Survey of Consumer Finances (SCF) conducted by the Federal Reserve, mortgage borrowers tend to have higher incomes than other households. For example, about 17 percent of NSMO respondents had total annual family income of less than \$50,000, while an estimated 16 percent of borrowers in the NSMO reported annual income of \$175,000 or more.<sup>4</sup> By comparison, according to estimates from the 2013 SCF, 53 percent of all families (including renters and homeowners that did not have a mortgage) had income less than \$50,000 and eight percent of all families had income of \$175,000 or more. Considering only families in the SCF who took out a mortgage or home-equity loan in 2013, 17 percent of these had income less than \$50,000 and 19 percent had annual income of at least \$175,000.

Two-thirds of survey respondents had a credit score of 720 or higher, 29 percent had a credit score between 620 and 719, and only four percent of respondents had a credit score below 620 (Table 3).

---

Source: National Survey of Mortgage Originations, 2013. Based on 6,078 survey responses.

Notes: 1. Credit score, loan size, mortgage term to maturity, and first-time homebuyer status are assembled from the National Mortgage Database. Credit score from Vantage ranges from 300 to 850. A homebuyer is classified as first-time if neither the respondent nor the spouse is older than 54 years in age and there is no evidence of a prior mortgage in the credit files.

2. Mortgages to purchase a property are classified as the "purchase" loan type and all other mortgages are classified as the "refinance" type.

3. If a refinance mortgage amount is higher than the prior mortgage amount or if a mortgage is for a previously mortgage-free property, the mortgage is classified as a cashout refinance.

**Table 3. Credit Score, by Demographic, Loan, and Property Characteristics**  
(Percentage Distribution)

Characteristics	Credit Score <sup>1</sup>										Share of All Loans	
	Lower than 620		620 to 679			680 to 719			720 or Higher

Source: National Survey of Mortgage Originations, 2013. Based on 6,078 survey responses.  
 Notes: 1. Credit score, loan size, mortgage term to maturity, and first-time homebuyer status are assembled from the National Mortgage Database. Credit score from Vantage ranges from 300 to 850. A homebuyer is classified as first-time if neither the respondent nor the spouse is older than 54 years in age and there is no evidence of a prior mortgage in the credit files.  
 2. Mortgages to purchase a property are classified as the "purchase" loan type and all other mortgages are classified as the "refinance" type.  
 3. If a refinance mortgage amount is higher than the prior mortgage amount or if a mortgage is for a previously mortgage-free property, the mortgage is classified as a cashout refinance.

The majority of 2013 mortgage loans reported in the survey were for refinancing an existing mortgage (Table 3). Sixty-one percent of survey respondents reported they refinanced an existing mortgage while 39 percent reported they purchased a home. An estimated 17 percent were refinances of the borrower's primary residence and included borrowing additional money, 40 percent were refinances of the borrower's primary residence without extracting equity and the remainder were refinancing of investment properties (three percent), seasonal homes (one percent), or a relative's home (one percent). Investors, including owners of seasonal and relative homes, represented eight percent of all mortgage borrowers in 2013. Owner occupants represented 92 percent of mortgage borrowers, with 35 percent purchasing a home and 57 percent refinancing an existing mortgage. Single-family properties were the primary property type used to collateralize the respondent's mortgage (Table 5). Eighty-four percent of the properties reported by survey respondents were single-family detached homes. Condominiums and townhouses were each reported by about six percent of respondents, and the remaining four percent of properties reported to be mobile homes and 2-, 3-, and 4-unit dwellings.

The estimates in Table 6 indicate that different life events had each affected about five percent of all recent mortgage borrowers overall. For example, six percent of all respondents indicated that they were divorced or separated in the last few years, and 10 percent indicated they had married or obtained a new partner. Roughly nine percent reported experiencing a disability or major illness and another three percent reported a disaster that affected their job. Finally, 28 percent indicated that they moved less than 50 miles from their previous residence, and 12 percent indicated that they have moved 50 miles or more from their previous residence. In general, each of the life events shown in Table 6 is common among most groups of borrowers.

#### **4. The Search for a Mortgage**

Mortgage shopping behavior differed significantly by borrower characteristics and by whether the consumer was also shopping for a home at the same time as the mortgage. First-time home buyers differed significantly from repeat home buyers in their mortgage search behavior and repeat borrowers differed significantly in their mortgage search behavior depending on whether they were refinancing or purchasing a home. Investors (non-occupant owners), both for home purchasers and refinancers, differed from other mortgage borrowers.

Searching for a mortgage is often intertwined with the search for a home, and the mortgage transaction can be heavily influenced by the housing transaction. Even when the consumer is refinancing an existing mortgage, the mortgage search can be confusing and stressful and the settlement process and expenses can influence the consumer's search behavior for the mortgage. Selecting a mortgage can be especially complicated for first-time borrowers. This section examines how respondents searched for a mortgage, with an emphasis on those buying their first property.

Source: National Survey of Mortgage Originations, 2013. Based on 6,078 survey responses.

Notes: 1. Credit score, loan size, mortgage term to maturity, and first-time homebuyer status are assembled from the National Mortgage Database. Credit score from Vantage ranges from 300 to 850. A homebuyer is classified as first-time if neither the respondent nor the spouse is older than 54 years in age and there is no evidence of a prior mortgage in the credit files.

2. Mortgages to purchase a property are classified as the "purchase" loan type and all other mortgages are classified as the "refinance" type.

3. If a refinance mortgage amount is higher than the prior mortgage amount or if a mortgage is for a previously mortgage-free property, the mortgage is classified as a cashout refinance.

Source: National Survey of Mortgage Originations, 2013. Based on 6,078 survey responses.

Notes: 1. Mortgages to purchase a property are classified as the "purchase" loan type and all other mortgages are classified as the "refinance" type.  
 2. Credit score and first-time homebuyer status are assembled from the National Mortgage Database. Credit score from Vantage ranges from 300 to 850. A homebuyer is classified as first-time if neither the respondent nor the spouse is older than 54 years in age and there is no evidence of a prior mortgage in the credit files.  
 3. If a refinance mortgage amount is higher than the previous mortgage or if a mortgage is for a previously mortgage-free property, it is classified as a cashout refinance.

The survey asked about each respondent's assessment of their prior knowledge about getting a mortgage to gauge their familiarity with the basics of mortgage loan terms. Overall only 3 to 10 percent of respondents reported that they were not at all familiar with either the types of mortgages available, the process, interest rate levels, down payment or income requirements or the type of credit history that was expected (Table 7). First-time buyers were even less likely to indicate that they were familiar with the process of taking out a mortgage, and the types of mortgages, or interest rates available compared both to borrowers who had bought a home before and to those who refinanced. First-time homebuyers were also much more likely compared to other borrowers to indicate that they were not at all familiar with the income required for a mortgage, credit history required, down payment, or the amount of money required at closing.

One fifth of young borrowers 35 years old or younger indicated that they were not at all familiar with the process of taking out a mortgage. Slightly more than 17 percent of households with less than \$50,000 in income indicated they were not at all familiar with the down payment required to purchase a house or the amount of money needed at closing. For borrowers with credit scores below 620, more than one-fifth reported that they were not at all familiar with the types of mortgages available.

The percentage reporting they were not at all familiar with each of the facets of the mortgage process generally declined as loan amount, education, credit score, and income increased. The number of persons feeling unfamiliar with the process were also comparatively high among Hispanic or non-white borrowers as well as for single-headed households.

These same patterns were true for the shares of borrowers that were concerned about qualifying for a mortgage. For example, approximately 12 percent of non-Hispanic white borrowers reported that they were very concerned with qualifying compared to nearly 28 percent of Hispanic or non-white borrowers. The difference in borrowers concerned about qualifying for a mortgage was starkest by credit score: 42 percent of those with scores below 620 were very concerned about qualifying, whereas only 10 percent of borrowers with scores of at least 720 were reportedly very concerned.

A substantial proportion of borrowers that refinanced their mortgage or looked for investment property had a firm idea about the type of mortgage they wanted (Table 8). The percentage of borrowers who said they had a firm idea increased with age and credit score. Fourteen percent of first-time buyers had little idea of what type of mortgage they wanted and slightly more than half had some idea, while only 36 percent of first-time buyers had a firm idea of the mortgage they wanted.

By the end of the process of getting their mortgage, about half of first-time buyers and those that refinanced a mortgage felt they were somewhat able to explain the process of taking out a

Table 7. Prior Knowledge About Getting a Mortgage and Concern About Qualifying, by Loan and Demographic Characteristics

Notes: 1. Mortgages to purchase a property are classified as the "purchase" loan type and all other mortgages are classified as the "refinance" type.

2. Credit score and first-time homebuyer status are assembled from the National Mortgage Database. Credit score from Vantage ranges from 300 to 850. A homebuyer is classified as first-time if neither the respondent nor the spouse is older than 54 years in age and there is no evidence of a prior mortgage in the credit files.

3. If a refinance mortgage amount is higher than the previous mortgage or if a mortgage is for a previously mortgage-free property, it is classified as a cashout refinance.

mortgage and more than 40 percent felt they were very confident in their ability to explain the mortgage process. For borrowers with \$175,000 or more in income, nearly six out of 10 were very confident in their ability to explain the process of taking out a mortgage, while fewer than four out of 10 borrowers in the lowest income range (less than \$50,000 in income), were very confident in their ability to explain the process. Nine percent of households with incomes less than \$50,000 and nine percent of households in which the respondent had a high school education or less were not at all confident about their ability to explain the process of taking out a mortgage.

Slightly more than 40 percent of all respondents reported having a difficult time explaining the difference between a prime and a subprime loan. This sizable share, however, might be expected since there is not a single definition of a subprime loan. The share of borrowers that were not at all confident in their ability to explain prime versus subprime loans exceeded 50 percent among first-time buyers, borrowers 35 years old or younger, borrowers taking out loans of \$50,000 or less, borrowers with credit scores of less than 620, or borrowers with household income of less than \$50,000. Overall more than one-quarter of borrowers reported that they could not explain amortization or the difference between the interest rate and APR on a loan. The percentages that reportedly were not able to explain these details of mortgages were generally highest among borrowers with a high school diploma or less education, first-time buyers, those taking out loans of \$50,000 or less, those with credit scores below 620, those with household incomes below \$50,000, single households, and Hispanic or non-white borrowers.

## 5. Selecting a Mortgage

Selecting a mortgage requires the borrower to balance many features that affect the total cost of owning a home. Table 9 shows that about two-thirds of respondents went directly to a lender for their mortgage rather than to a mortgage broker. For the smallest loan size, \$50,000 or less, nearly 85 percent of borrowers went directly to the lender. Borrowers who obtained loans greater than \$300,000 and homeowners who were repeat buyers were relatively more likely than other groups to use a broker, with more than 40 percent of borrowers in these groups reporting they used a broker. Borrowers initiated contact with the lender or broker 69 percent of the time, lenders initiated contact 16 percent, and a third party initiated contact for 15 percent of respondents. The share of loans for which a third party initiated contact was more than double (31 percent) for home purchase loans than for all respondents. Just 12 percent of first-time homebuyers and 4 percent of overall respondents used housing counselors or courses on home ownership.

The survey asked the number of lenders a borrower seriously considered when selecting a mortgage. Table 10 shows that more than half of all borrowers, 51 percent, considered applying to only one lender. One-third, 34 percent, seriously considered two lenders and 15 percent

- Notes: 1. Mortgages to purchase a property are classified as the "purchase" loan type and all other mortgages are classified as the "refinance" type.  
 2. Credit score and first-time homebuyer status are assembled from the National Mortgage Database. Credit score from Vantage ranges from 300 to 850. A homebuyer is classified as first-time if neither the respondent nor the spouse is older than 54 years in age and there is no evidence of a prior mortgage in the credit files.  
 3. If a refinance mortgage amount is higher than the previous mortgage or if a mortgage is for a previously mortgage-free property, it is classified as a cashout refinance.

- Notes: 1. Mortgages to purchase a property are classified as the "purchase" loan type and all other mortgages are classified as the "refinance" type.
- 2. Credit score and first-time homebuyer status are assembled from the National Mortgage Database. Credit score from Vantage ranges from 300 to 850. A homebuyer is classified as first-time if neither the respondent nor the spouse is older than 54 years in age and there is no evidence of a prior mortgage in the credit files.
- 3. If a refinance mortgage amount is higher than the previous mortgage or if a mortgage is for a previously mortgage-free property, it is classified as a cashout refinance.

considered more than two lenders. The percentage of borrowers that considered just one lender declined with their annual income, from nearly 60 percent for those with income of \$50,000 or less, to 44 percent for those with income of \$175,000 or more. Nearly 52 percent of non-Hispanic white borrowers seriously considered only one lender, while 46 percent non-white or Hispanic borrowers did so.

When looking at actual mortgage applications, 81 percent of borrowers applied to just one lender. First-time purchasers were the least likely to apply to just one lender at 69 percent. Not quite one-quarter of first-time purchasers applied to two lenders compared with 16 percent for borrowers as a whole. Borrowers aged 35 years old or younger reported applying to two lenders 21 percent of the time. The overall rate of applicants who applied to three lenders was just three percent and less than one percent reportedly applied to more than three lenders. The share of non-Hispanic white borrowers who applied to only one lender was about five percentage points higher than the share for non-white or Hispanic borrowers (82 percent and 77 percent, respectively). While some consumers applied to multiple lenders to get better terms, others went “shopping” because they got denied. It is difficult to know if younger borrowers, for example, are savvier about shopping or just had to apply to more lenders before they found one to approve them.

Borrowers were asked how important a variety of factors were in selecting a lender or broker. Table 11 lists the responses to these questions. Borrowers indicated that the lender’s reputation, the lenders’ location, and having an established banking relationship with a lender were important considerations in choosing a lender or broker. In particular, the lender’s reputation was very important to 40 percent and somewhat important to 27 percent of borrowers. Having a local office or branch nearby was very important to 36 percent of borrowers and somewhat important to 25 percent, and the banking relationship was very important to 46 percent of borrowers and somewhat important to an additional 24 percent.

Borrowers also identified factors that were unimportant when selecting a lender. For example, whether the lender spoke the borrower’s primary language (91 percent), was recommended by a website (86 percent), or was a credit union (67 percent) were reported as not at all important by borrowers. Home purchasers were nearly twice as likely (70 percent) as those who refinanced (39 percent) to report that a lender used previously was unimportant, and purchasers were less likely than those refinancing loans to say that an agent’s recommendation was unimportant (43 percent and 86 percent, respectively).

More than half of borrowers refinancing a mortgage reported that using a lender with an established banking relationship was very important (Table 12). More than three in 10 first-time homebuyers and of borrowers aged 35 years or younger found recommendations from a friend, relative, or co-worker very important in selecting a lender or broker. Home purchasers were

much more likely than those refinancing an existing mortgage to report that recommendations from a real estate agent or a home builder were very important.

The NSMO asked how important a variety of mortgage terms or features were in the borrower's selecting a mortgage. A low interest rate was very important to 96 percent of borrowers and a low Annual Percentage Rate (APR) was very important to 82 percent (Table 13). Low closing fees were very important to 71 percent of borrowers and somewhat important for 24 percent more. Only 50 percent overall reported that a low down payment was very important. However, 60 percent or more of first-time home buyers (59 percent), borrowers with income below \$50,000 (63 percent), borrowers with at most a high school education (67 percent), and borrowers with low credit scores (68 percent) said a low down payment was very important in choosing the mortgage (Table 14).

A low monthly payment was very important to 65 percent overall of borrowers. However, over 70 percent of borrowers with a high school education or less, and those with household income below \$50,000 as well as borrowers with credit scores below 620 reported that low monthly payments were very important.

## 6. During the Application Process

The NSMO found that many lenders requested that the borrower provide additional information or perform additional steps after the initial loan application. Nearly 18 percent of borrowers reported being asked to resolve problems that appeared on a credit report (Table 15). The share of borrowers that fixed problems with their credit reports differed sharply by credit score: about one third of borrowers with credit scores of 679 or lower addressed an issue, compared with 11 percent of borrowers with scores 720 or greater. The share of borrowers that resolved credit-report issues also declined with education, falling from about 22 percent among borrowers in high school or less and some college to 14 percent among those in the postgraduate group.

Roughly one in five borrowers had to delay their closing date. Delays were somewhat more common for purchase mortgages than for refinances. The fraction that reported the closing date had been delayed ranged from 25 to 28 percent across the three groups of purchasers compared with a range of 16 to 22 percent for borrowers in the refinance groups.

Delays in closing may have arisen from needing to answer follow-up questions, having to redo paperwork, or needing an additional appraisal. Almost 60 percent of respondents reported answering follow-up requests for more information, but only one-fifth reported having to redo paperwork during the application process. The fraction of borrowers that redid paperwork was fairly steady across groups defined by demographics and loan characteristics. In contrast, the estimated fraction that answered follow-up questions varied more noticeably. Nearly two-thirds

2. Credit score and first-time homebuyer status are assembled from the National Mortgage Database. Credit score from Vantage ranges from 300 to 850. A homebuyer is classified as first-time if neither the respondent nor the spouse is older than 54 years in age and there is no evidence of a prior mortgage in the credit files.

3. If a refinance mortgage amount is higher than the previous mortgage or if a mortgage is for a previously mortgage-free property, it is classified as a cashout refinance.

of borrowers with loans of more than \$300,000 had to answer follow-up requests, for example, while just 53 percent of loans of less than \$50,000 involved such requests. The percentage of borrowers that responded to follow-up requests also rose with income and education, but the percentage fell with credit score. Purchasers were also more likely to have answered follow-up questions than those who refinanced.

Very few borrowers—just seven percent—reported needing multiple appraisals. The percentage of borrowers that required multiple appraisals was somewhat higher for homebuyers with the lowest credit score and for those with loans for more than \$300,000.

## 7. Closing on a Mortgage

Closing on a mortgage is a complex process that involves substantial paperwork and a range of costs and services associated with the loan. This section examines the NSMO questions about the closing process, including locking the interest rate, the sources of information used by borrowers about their closing, funding the closing costs, finding a settlement agent, title insurance, and other features of the mortgage. Table 16 presents the response to these questions.

Forty-seven percent locked their rate when they applied for the loan, 44 percent locked their rate between the application and closing date, and 10 percent waited for the closing date to lock their interest rate.

Fifty-seven percent of borrowers reported seeking input on the closing from the lender or broker. Twenty-three percent of all borrowers and 58 percent of first-time homebuyers asked their real estate agent for input about their closing documents. Only 11 to 17 percent of borrowers reportedly sought input from the settlement agent, an attorney, the title agent, or a trusted friend, and less than one percent turned to a housing counselor for input on the mortgage closing.

The survey asked the borrower to report who paid any of the closing costs. Because costs could be funded through multiple sources, the shares do not add up to 100 percent. The borrower paid at least some of the costs of closing the loan on 57 percent of loans (Table 17). In purchase transactions, about 79 percent of borrowers paid their own closing costs. The lender and seller were less likely to have paid some or all of the closing costs (15 percent and 12 percent of loans, respectively). Closing costs were added to the mortgage amount for 35 percent of loans.

Respondents were also asked about their search for a settlement agent and the features present in the mortgage they obtained. Table 18 lists the responses to these questions. Almost two-thirds of respondents indicated that the lender recommended the settlement agent. More than one-fifth of borrowers overall indicated they selected an agent they had used previously, with slightly

Source: National Survey of Mortgage Originations, 2013. Based on 6,078 survey responses.

Notes: 1. Mortgages to purchase a property are classified as the "purchase" loan type and all other mortgages are classified as the "refinance" type.  
2. Credit score and first-time homebuyer status are assembled from the National Mortgage Database. Credit score from Vantage ranges from 300 to 850. A homebuyer is classified as first-time if neither the respondent nor the spouse is older than 54 years in age and there is no evidence of a prior mortgage in the credit files.

3. If a refinance mortgage amount is higher than the previous mortgage or if a mortgage is for a previously mortgage-free property, it is classified as a cashout refinance.

- Notes: 1. Mortgages to purchase a property are classified as the "purchase" loan type and all other mortgages are classified as the "refinance" type.
- 2. Credit score and first-time homebuyer status are assembled from the National Mortgage Database. Credit score from Vantage ranges from 300 to 850. A homebuyer is classified as first-time if neither the respondent nor the spouse is older than 54 years in age and there is no evidence of a prior mortgage in the credit files.
- 3. If a refinance mortgage amount is higher than the previous mortgage or if a mortgage is for a previously mortgage-free property, it is classified as a cashout refinance.

greater shares for investors and those that refinanced. Twelve percent of borrowers shopped around for a settlement agent to handle their closing.

Borrowers reported that 77 percent of their mortgages included an escrow account for taxes or homeowner insurance. Among mortgage features reported, only three percent of all loans included a pre-payment penalty, and just two percent included a balloon payment feature. About five percent of mortgages reportedly included credit life, debt suspension, or debt cancellation insurance. These types of insurance were more common among first-time homebuyers and borrowers with credit scores less than 620, incomes less than \$50,000, or high school or less education.

## 8. Satisfaction with Mortgage Terms, Mortgage Process and Information

Table 19 presents mortgage borrowers' satisfaction with the terms, interest rate, and closing costs received on their most recent mortgages. Eighty percent indicated that they were very satisfied with the general terms of their mortgage, and 18 percent more indicated that they were somewhat satisfied. Only two percent of respondents indicated that they were not at all satisfied with their mortgage terms. There was little variation in reported satisfaction across groups of borrowers.

Borrowers were slightly less satisfied with the interest rate received on their mortgage. More than three-quarters of respondents indicated that they were very satisfied with their interest rate. Overall, four percent of borrowers were not satisfied with their interest rate. Borrowers with credit scores less than 620 (eight percent), those with household incomes of less than \$50,000 (seven percent), and those with a high school education (eight percent) were more likely to report being dissatisfied with their interest rate.

Respondents were notably less likely to report that they were very satisfied with closing costs than they were with terms and interest rates. Approximately 58 percent were very satisfied and 33 percent were somewhat satisfied that they received the lowest closing costs. Nine percent were not at all satisfied with their closing costs. Borrowers with household incomes of less than \$50,000 (13 percent), borrowers with a high school education or less (11 percent), Hispanic or non-white borrowers (11 percent), and borrowers with small balance mortgages (11 percent) were more likely to be dissatisfied with their closing costs.

Table 20 presents the overall satisfaction with the lender or broker used by the borrower, the mortgage application process, and the loan closing process. More than 95 percent of all respondents indicated that they were very or somewhat satisfied with the lender or broker they used. Three out of four respondents were reportedly very satisfied with their lender; only four percent were dissatisfied with their lender. There was generally little variation across borrower

- Notes: 1. Mortgages to purchase a property are classified as the "purchase" loan type and all other mortgages are classified as the "refinance" type.
- 2. Credit score and first-time homebuyer status are assembled from the National Mortgage Database. Credit score from Vantage ranges from 300 to 850. A homebuyer is classified as first-time if neither the respondent nor the spouse is older than 54 years in age and there is no evidence of a prior mortgage in the credit files.
- 3. If a refinance mortgage amount is higher than the previous mortgage or if a mortgage is for a previously mortgage-free property, it is classified as a cashout refinance.

groups, although borrowers with credit scores less than 620 or income of \$50,000 or less were more likely to be dissatisfied with their lender.

Overall, nearly 90 percent of respondents reported that they were very or somewhat satisfied with the mortgage application process. Approximately 63 percent reported they were very satisfied, and an additional 29 percent were somewhat satisfied. Nearly 8 percent were not at all satisfied. There was little variation in the estimated shares of borrowers who reported they were satisfied with the process. Investors who purchased a house or refinanced a mortgage (14 and 10 percent, respectively) and respondents in the highest income group (11 percent) were most likely to be dissatisfied with the application process.

Similarly, all but eight percent of respondents reported that they were very or somewhat satisfied with the mortgage closing process; 66 percent reported that they were very satisfied and 26 percent reported that they were somewhat satisfied. Among those borrowers who were more likely to be dissatisfied with the closing process were investors who purchased a house (10 percent), borrowers with credit scores between 620 and 679 (10 percent), non-white borrowers (nine percent), and borrowers who earn \$50,000 or less per year (nine percent).

Table 21 presents the overall satisfaction of 2013 borrowers with the information in mortgage disclosure documents, the timeliness of the mortgage disclosure documents, and their settlement agent. The vast majority of respondents indicated they were very or somewhat satisfied with the information (95 percent), timeliness of the mortgage disclosure process (92 percent), and with their settlement agent (95 percent). Investors and borrowers in the lowest income and credit-score groups were somewhat more likely to report that they were not at all satisfied with the disclosures, timeliness, or settlement agent, and borrowers older than 65 tended to be more likely to report they were very satisfied with these aspects of the mortgage process

## 9. Opinions on Financial Responsibility

The survey asked borrowers whether they agreed or disagreed with statements about financial responsibility. Table 22 presents the shares of borrowers who agreed with each of these statements. For example, about 95 percent of respondents agreed that owning a home is a good financial investment and the share that agreed exceeded 90 percent for all groups of borrowers.

In general, respondents believe that mortgage lenders treat borrowers well. Seventy-six percent of respondents agreed that lenders treat borrowers well. The percentage of respondents that reported they felt lenders treat borrowers well declined with education and loan size. Seventy-eight percent of non-Hispanic white borrowers stated that they believe lenders treat borrowers well, compared with 70 percent of Hispanics or non-whites.

- Notes: 1. Mortgages to purchase a property are classified as the "purchase" loan type and all other mortgages are classified as the "refinance" type.  
 2. Credit score and first-time homebuyer status are assembled from the National Mortgage Database. Credit score from Vantage ranges from 300 to 850. A homebuyer is classified as first-time if neither the respondent nor the spouse is older than 54 years in age and there is no evidence of a prior mortgage in the credit files.  
 3. If a refinance mortgage amount is higher than the previous mortgage or if a mortgage is for a previously mortgage-free property, it is classified as a cashout refinance.

- Notes: 1. Mortgages to purchase a property are classified as the "purchase" loan type and all other mortgages are classified as the "refinance" type.  
 2. Credit score and first-time homebuyer status are assembled from the National Mortgage Database. Credit score from Vantage ranges from 300 to 850. A homebuyer is classified as first-time if neither the respondent nor the spouse is older than 54 years in age and there is no evidence of a prior mortgage in the credit files.  
 3. If a refinance mortgage amount is higher than the previous mortgage or if a mortgage is for a previously mortgage-free property, it is classified as a cashout refinance.

Borrowers were also asked whether late payment of their mortgage would lower their credit ratings. More than nine out of 10 respondents agreed that late payments would lower their credit ratings. The estimated shares within groups varied little, ranging from 96 percent for investors who purchased a property to 87 percent for respondents with at most a high school education. In contrast, just 14 percent of respondents agreed with the statement that lenders should not care about late payments, only whether loans are fully repaid. This share that reportedly agreed with this statement differed widely across groups, from 10 percent for borrowers in the highest income category to about 20 percent among those who borrowed \$50,000 or less and about 21 percent for borrowers who had a credit score between 620 and 679. The shares decreased across the loan size, education, and income categories but increased across age categories.

Respondents were far less likely to agree with the statement that it is okay to default or stop paying if it is in the borrower's financial interest. An estimated seven percent of respondents agreed with this statement, with those older than 65 (five percent), non-Hispanic white respondents (six percent), and those respondents with low balance mortgages (five percent) least likely to agree with this statement. Hispanic or non-white borrowers (nine percent), investors (eight percent), respondents with postgraduate degrees (nine percent), and borrowers with large balance mortgages (nine percent) were more likely to agree that it is okay to default when it is in the borrower's financial interest.

## 10. Recent Changes in Neighborhood Housing

Tables 23 and 24 present respondents' opinions on changes to the neighborhoods where homes were located for which they had most recently acquired a mortgage. New borrowers in 2013 were asked if the number of homes in the neighborhood for sale, for rent, that were vacant, and that were foreclosed or sold as a short sale had significantly increased, experienced little or no change, or had significantly decreased over the last couple of years. They were also asked their opinion on changes to house prices and the overall desirability of living in the neighborhood.

Two out of three indicated that the number of homes available for sale in their neighborhood experienced little or no change, while slightly more than a quarter reported that the number for sale had increased significantly. Less than six percent of respondents reported the number of homes for sale declined significantly in their neighborhood. There was little variation across borrower groups, for either significant increase or significant decrease. Borrowers with large loans (nine percent) and borrowers with high incomes (eight percent) reported a decrease in available homes for sale, slightly more than what other borrowers reported.

Different borrower groups varied sharply in their descriptions of changes in the number of vacant homes in the neighborhood and clearly described distinctly different neighborhoods. Overall, one out of eight respondents indicated that the number of vacant homes increased significantly,

Source: National Survey of Mortgage Originations, 2013. Based on 6,078 survey responses.

Notes: 1. Mortgages to purchase a property are classified as the "purchase" loan type and all other mortgages are classified as the "refinance" type.  
 2. Credit score and first-time homebuyer status are assembled from the National Mortgage Database. Credit score from Vantage ranges from 300 to 850. A homebuyer is classified as first-time if neither the respondent nor the spouse is older than 54 years in age and there is no evidence of a prior mortgage in the credit files.  
 3. If a refinance mortgage amount is higher than the previous mortgage or if a mortgage is for a previously mortgage-free property, it is classified as a cashout refinance.

nearly 80 percent indicated that there was little or no change, and almost eight percent reported that the number of vacant homes had declined significantly. Borrowers with a high school education or less (17 percent), borrowers with lower household income (17 percent), borrowers with very low to moderately low credit scores (15 percent), and respondents with mortgages less than \$50,000 (22 percent) reported a significant increase in vacant homes in their neighborhood over the last two years. By contrast, respondents with very high income (seven percent) and borrowers with larger mortgages (six percent) were less likely to report a significant increase in vacant homes.

Different borrower groups also varied in their responses about the changes in the number of houses for rent in their neighborhood. Overall, slightly more than 12 percent of respondents reported a significant increase in rental housing, slightly more than 82 percent of borrowers reported little or no change, and only five percent reported a significant decrease in the number of rental homes. Borrowers who took out a smaller mortgage (18 percent), or who had very low credit scores (17 percent), respondents with a high school education or less (15 percent), and low income borrowers (16 percent) were more likely to report a significant increase in the number of rental properties in their neighborhoods than were other borrowers.

Nearly three-quarters of respondents indicated that the number of foreclosures and short sales in their neighborhood had little or no change over the last couple of years (Table 24). Fifteen percent of respondents reported a significant increase and 10 percent reported a significant decrease. Borrowers who took out small mortgages (21 percent), had low credit scores (18 percent), and have a high school education or less (19 percent) reported a larger increase in the number of foreclosures.

Fifty-eight percent of respondents reported that there was little or no change to house prices in their neighborhood over the last couple of years, while 27 percent reported a significant increase in prices and 16 percent of respondents reported significant decline in house prices in their neighborhood. However, respondents who took out large mortgages (43 percent), high income borrowers (37 percent), and borrowers with postgraduate degrees (31 percent) were far more likely to report a significant increase in house price over the last couple years than were other respondents. Individuals, who purchased a home, including investors and first-time buyers, were far less likely to report a significant decline in house price (eight percent) than were respondents who refinanced a mortgage (21 percent).

Borrowers were asked if the overall desirability of living in their neighborhood had changed over the last couple of years. Nearly three out of four indicated that there had been little or no change in desirability, 21 percent reported a significant increase in desirability and only five percent reported a significant decline. There was little to no variation across borrower groups.

**Table 24. Changes in Neighborhood Desirability over Last Couple Years, by Loan and Demographic Characteristics**  
(Percentage Distribution)

Characteristics	Number of Foreclosures or Short Sales			House Prices			Overall Desirability of Living There

Source: National Survey of Mortgage Originations, 2013. Based on 6,078 survey responses.

Notes: 1. Mortgages to purchase a property are classified as the "purchase" loan type and all other mortgages are classified as the "refinance" type.  
 2. Credit score and first-time homebuyer status are assembled from the National Mortgage Database. Credit score from Vantage ranges from 300 to 850. A homebuyer is classified as first-time if neither the respondent nor the spouse is older than 54 years in age and there is no evidence of a prior mortgage in the credit files.  
 3. If a refinance mortgage amount is higher than the previous mortgage or if a mortgage is for a previously mortgage-free property, it is classified as a cashout refinance.

## 11. Expectations on Neighborhood House Prices and Neighborhood Desirability

Respondents were asked what they think will happen to prices of homes in their neighborhood over the next couple of years. Nearly 77 percent of all respondents expect house prices to increase, with 62 percent expecting that prices will increase a little and 15 percent expecting that prices will increase a lot (Table 25). Nearly 19 percent of respondents indicated that prices would remain about the same over the next couple of years and just four percent of respondents expect prices to decrease. The percentage of borrowers who reportedly expect price increases generally rose with loan size and borrower income, and both the share expecting home prices to remain about the same and the share expecting price declines decreased with loan size and income. There was generally little variation across other groups of borrowers in expectations on neighborhood house prices.

Borrowers were also asked whether they expect the overall desirability of living in their neighborhood to change in the next couple of years (Table 26). About 74 percent of respondents indicated that they expected overall desirability of their neighborhood to stay about the same, 23 percent of respondents expected neighborhood desirability to increase, and 3 percent of respondents expected neighborhood desirability to decrease. Refinancing investors, borrowers with loans for less than \$150,000, borrowers with credit scores of 679 or less, borrowers with at most a high school education, and borrowers with household income of less than \$50,000 were more likely than other groups of borrowers to expect that neighborhood desirability would decrease.

## 12. Financial Expectations

The NSMO survey asked borrowers how likely they were to encounter events in the next couple of years that might constrain their household finances. Specifically, the survey asked the likelihood over the next couple of years that the respondent would: retire; be laid off, become unemployed, or be forced to reduce hours of work; have difficulties making their mortgage payments; or experience some other personal financial crisis.

Twenty-three percent of respondents indicated they were likely to retire in the next couple of years (Table 27). Not surprisingly, this fraction was about twice as high for respondents who were older than 56 than those aged 46 to 55 years old, while six percent of respondents aged 36 to 45 years old and three percent of respondents aged 35 years or younger indicated they would retire in the next couple of years. Only three percent of first-time homebuyers indicated they were likely to retire in the next couple of years, while 34 percent of investors purchasing a home expressed the expectation of retiring in the near term.

Source: National Survey of Mortgage Originations, 2013. Based on 6,078 survey responses.

- Notes: 1. Mortgages to purchase a property are classified as the "purchase" loan type and all other mortgages are classified as the "refinance" type.  
 2. Credit score and first-time homebuyer status are assembled from the National Mortgage Database. Credit score from Vantage ranges from 300 to 850. A homebuyer is classified as first-time if neither the respondent nor the spouse is older than 54 years in age and there is no evidence of a prior mortgage in the credit files.  
 3. If a refinance mortgage amount is higher than the previous mortgage or if a mortgage is for a previously mortgage-free property, it is classified as a cashout refinance.

Fifteen percent of respondents expected to have difficulties in making their mortgage payments in the next couple of years. Respondents with very low credit scores (30 percent), high school education or less (23 percent), or household income less than \$50,000 a year (28 percent) were more likely to believe they will have difficulties than other respondents. Conversely, respondents with very high credit scores (13 percent), postgraduate degrees (11 percent), or household income \$175,000 or more (seven percent) were less likely to believe they will have difficulties in paying their mortgage in the next couple of years.

Nearly one out of five respondents indicated that it is likely they might experience a layoff, unemployment, or forced reduction in hours over the next couple of years. This fraction was generally similar across groups, although respondents with a high school education at most (21 percent), borrowers with low credit scores (24 percent), and those earning \$50,000 or less (22 percent) were somewhat more likely to believe they are at risk than were other respondents.

Twenty-two percent of all respondents indicated that it was likely that they would face some other personal financial crisis in the next couple of years. Respondents with household income of less than \$50,000 (33 percent), respondents with credit scores below 620 (35 percent), respondents older than 65 (25 percent), and respondents with only a high school education (27 percent) felt that they were most at risk of a personal financial crisis.

Nearly 85 percent of respondents indicated they had the ability to pay their bills for the next three months without borrowing (Table 28). Respondents with household income \$175,000 or more (94 percent) and respondents with loans more than \$300,000 (91 percent) were more likely than other respondents to indicate they had the ability to weather an adverse financial shock. Respondents with household income less than \$50,000 (76 percent) and respondents with only a high school education (76 percent) report that they were less able to weather a financial shock.

Fifty-five percent of respondents indicated that they could get significant financial help from family or friends if they suffered an adverse financial shock. Respondents aged 56 to 65 (39 percent) and respondents 65 years and older (31 percent) were the least likely to feel that they could get significant help from family or friends. Respondents aged 35 years or younger (75 percent) were most likely to feel that they could get financial help from their family or friends.

Fifty percent of respondents felt that they could significantly increase their income if they experienced a financial shock. First-time homebuyers (64 percent), respondents 35 years or younger (64 percent), and respondents with incomes of \$175,000 or more (57 percent) were more likely to indicate they could significantly increase their income. Older respondents were less likely to indicate they could significantly increase their income. Respondents aged 56 to 65 years old (42 percent) and respondents older than 65 years (29 percent) were the least likely to report that they could significantly increase their income if they experienced a financial shock.

**Table 28. Ability to Weather an Adverse Financial Shock, by Loan and Demographic Characteristics**  
(Percent Very or Somewhat Likely to Perform Each Action in the Next Couple of Years)

Source: National Survey of Mortgage Originations, 2013. Based on 6,078 survey responses.

Notes: 1. Mortgages to purchase a property are classified as the "purchase" loan type and all other mortgages are classified as the "refinance" type.  
2. Credit score and first-time homebuyer status are assembled from the National Mortgage Database. Credit score from Vantage ranges from 300 to 850. A homebuyer is classified as first-time if neither the respondent nor the spouse is older than 54 years in age and there is no evidence of a prior mortgage in the credit files.

3. If a refinance mortgage amount is higher than the previous mortgage or if a mortgage is for a previously mortgage-free property, it is classified as a cashout refinance.

### 13. Summary and Further Work

This technical paper draws on the nationally representative data in the NSMO to provide a broad-brush picture of the mortgage-related experiences, choices, and outcomes of borrowers who took out a mortgage in 2013. Originations in 2013 were influenced by favorable interest rates that led to many refinancing transactions. New rules for mortgages were issued in 2013 that took effect in early 2014. The next report on mortgage originations from the NSMO will provide information about the 2014 mortgage originations.

## Appendix

The National Mortgage Database is a multiyear project being jointly undertaken by the Federal Housing Finance Agency (FHFA) and the Consumer Financial Protection Bureau (CFPB). The project is designed to provide comprehensive information about the U.S. mortgage market based on a five percent sample of residential mortgages. The project has three primary components: (1) the NMDB<sup>5</sup>, (2) the quarterly NSMO<sup>6</sup> and (3) the annual American Survey of Mortgage Borrowers (ASMB).

The NMDB project will enable FHFA to meet the statutory requirements of section 1324(c) of the Federal Housing Enterprises Financial Safety and Soundness Act of 1992, as amended by the Housing and Economic Recovery Act of 2008, to conduct a monthly mortgage market survey. Specifically, FHFA must, through a survey of the mortgage market, collect data on the characteristics of individual mortgages, including subprime and nontraditional mortgages, and information on the creditworthiness of borrowers, including a determination of whether subprime and nontraditional borrowers would have qualified for prime lending.

For CFPB, the NMDB project will support policymaking and research efforts and help identify and understand emerging mortgage and housing market trends. CFPB expects to use the NMDB, among other purposes, in support of the market monitoring called for by the Dodd-Frank Wall Street Reform and Consumer Protection Act, including understanding how mortgage debt affects consumers.

FHFA and CFPB have examined existing databases and determined that none of them fully meet the criteria necessary to achieve the above objectives. The NMDB, when fully complete, will be a de-identified, loan-level database of closed-end first-lien residential mortgages. It will: (1) be representative of the market as a whole; (2) contain comprehensive information on the terms and performance of mortgages, as well as characteristics of the associated borrowers and property; (3) be continually updated; (4) have an historical component dating back before the financial crisis of 2008; and (5) provide a sampling frame for the NSMO and ASMB.

The core data in the NMDB are drawn from a random 1-in-20 sample of all closed-end first-lien mortgage files outstanding at any time between January 1998 and June 2012 and maintained by Experian, one of the three national credit repositories. A random 1-in-20 sample of mortgages newly reported to Experian is added each quarter. Mortgages are followed in the NMDB database until they terminate through prepayment (including refinancing), foreclosure, or maturity. De-identified information from credit repository files related to each borrower associated with the mortgages in the NMDB sample is collected from at least one year prior to origination to one year after termination of the mortgage. The information on borrowers and

loans available for analysis is de-identified and does not include directly-identifiable information, such as borrower name, address, or Social Security number.

The NSMO is a component of the NMDB project. The survey is designed to complement the NMDB by providing information, particularly related to mortgage shopping, that is not otherwise available in the database. The survey is completely voluntary and its target universe is newly originated closed-end first-lien residential mortgages and the associated borrowers. To achieve this objective, the NSMO draws its sample from mortgages that are part of the NMDB, which samples from the same target universe.

The NSMO is administered by Westat under a subcontract with Experian. Fair Credit Reporting Act (FCRA) rules require that the survey process, be administered through Experian in order to maintain consumer privacy because it utilizes borrower names and addresses drawn from credit repository records.

Each quarter, the NSMO sample is selected from the mortgage loans newly added to the NMDB sample that quarter. After the sample is selected, Experian eliminates any potential respondents who have opted out of previous surveys or are deemed not to have useable addresses or names.

Industry guidance (Metro 2<sup>®</sup> Industry Standards for Credit Reporting) requires that servicers must supply a billing address for each borrower on a trade line (including mortgages). Experian generally uses these borrower billing addresses as the survey mailing addresses. However, where there are multiple addresses and borrowers associated with a survey sample loan, Table A-1 presents the rules for selecting the borrower(s) and address to which the survey is mailed. The survey is sent to no more than two borrowers who share a common address. FHFA and CFPB never receive the names or addresses chosen for the survey. Only Experian and Westat, as Experian’s subcontractor, have access to this information.

**Table A-1. Rule for Best Address**

Number of Borrowers	Same or Different Address	Resulting Survey Recipient
1	Not Applicable	One borrower with Experian’s associated best address
2	Same	Two borrower names with one common best address
2	Different	The one borrower and associated best address with the lowest number of open mortgages
>2	Same	Two borrowers with one common best address that has the highest number of trade lines reported
>2	Different	The one borrower and associated best address with the lowest number of open mortgages

The survey implementation strategy comprises four respondent contacts over a seven-week period:

- Week 1 Printed questionnaire, cover letter, and cash incentive (entire survey sample population)
- Week 2 1st reminder letter (entire survey sample population)
- Week 5 2nd reminder letter, printed questionnaire, and additional cash incentive (sampled borrowers who have not responded by Week 4)
- Week 7 3rd reminder letter, which includes the due date for returning the questionnaire, to close the communication loop (sampled borrowers who have not responded by Week 6)

Participation in the survey is completely voluntary and respondents are assured the confidentiality in their responses. The first and the third contacts contain a printed survey questionnaire and a five dollar cash incentive which respondents are free to keep regardless of whether they return the questionnaire. The mailings and printed questionnaires detail how respondents can also complete the survey online in either English or Spanish using instructions and a unique “survey PIN number” provided in the questionnaire packet. About one quarter of survey responses are completed online.

Mail surveys are processed for four weeks after the third reminder letter, so the field period comprises 11 weeks in total. It takes between five and six weeks to draw the new NMDB sample, identify and combine duplicative records, draw the NSMO sample, process it at Experian, and print the survey materials. Thus, the survey cycle typically begins six weeks after the end of a quarter and extends about four weeks into the next quarter.

All returned questionnaires and any non-delivered mail are sent directly to Westat and not to FHFA, CFPB, or Experian. All survey responses received by Westat are purged of any information related to the name of the borrower, address of the borrower, or name of any financial institution. This is done to maintain the de-identified confidential nature of the data and to ensure that the survey responses cannot be connected to a name or address.

During the first eight weeks of each cycle, Experian maintains a NSMO call center to address any questions by respondents. This call center also allows respondents to “opt out” of the survey and future surveys. Both FHFA and CFPB describe the survey on their websites so that respondents can independently validate the legitimacy of the survey. The agency officials signing the cover letter (Sandra Thompson at FHFA and David Silberman at CFPB) are identified on the websites as senior employees of their respective agencies.

Once the active phase of a survey cycle ends, it takes about 25 days for Westat to scan and edit returned questionnaires, combine them with on-line responses, and create an electronic data file. This file is delivered to the NMDB development staff, through Experian. It takes an additional

eight weeks to complete additional cleaning and editing of survey responses, to create preliminary sample weights, and to assemble a preliminary user data file.

The timeline described above applies to each quarterly data release. Because some loans can take longer than six months to be reported to the repositories, a data file fully representative of a calendar year will generally not be available until December of the following year.
